This section explored taxation, subsidies, price controls, and their roles in managing the economy.

Key Points:

- Objectives of government intervention
- Types of taxes and their impact
- Advantages and disadvantages of subsidies
- Price controls: Price ceilings and floors

Detailed Breakdown of Selected Questions and Solutions**Question 1: Define and explain the law of demand. Illustrate your answer with a demand curve.****Solution:**

The law of demand states that, *ceteris paribus* (all other factors being equal), as the price of a good or service decreases, the quantity demanded by consumers increases. Conversely, as the price increases, the quantity demanded decreases. This inverse relationship is graphically represented by a downward-sloping demand curve.

Explanation:

- Consumers tend to buy more at lower prices because the opportunity cost of purchasing is reduced.
- Higher prices discourage consumption, leading to a decrease in quantity demanded.
- The demand curve slopes downward from left to right, illustrating this inverse relationship.

Demand Curve Illustration:

- On a graph, the vertical axis (Y-axis) represents price.
- The horizontal axis (X-axis) represents quantity demanded.
- The curve slopes downward, demonstrating the law.

Marking points:

- Clear definition of the law of demand.

- Correct diagram showing the demand curve.
- Explanation of the inverse relationship.

Question 2: List and explain three factors that can cause shifts in the demand curve.

Solution:

Factors that cause the demand curve to shift include:

- **Consumer Income:** An increase in consumer income generally leads to an increase in demand for normal goods, shifting the demand curve to the right. Conversely, demand for inferior goods decreases, shifting the demand curve left.
- **Tastes and Preferences:** Changes in consumer preferences, such as increased popularity of a product, cause demand to rise (shift right). Negative publicity or loss of interest shifts demand left.
- **Prices of Related Goods:** The demand for a good can be affected by the prices of substitutes (goods that can replace it) and complements (goods used together). For example, a rise in the price of tea may increase demand for coffee (substitute), shifting the demand curve for coffee right. If the price of printers drops, demand for ink cartridges may increase (complement).

Question 3: Explain the concept of market equilibrium. How is it achieved?

Solution:

Market equilibrium occurs when the quantity of goods supplied equals the quantity demanded at a specific price level. At this point, there is no tendency for the price to change, and the market is considered stable.

How it is achieved:

- When prices are above equilibrium, there is excess supply (surplus), prompting sellers to lower prices.
- When prices are below equilibrium, there is excess demand (shortage), pushing prices upward.
- Over time, these price adjustments continue until supply equals demand, establishing equilibrium.

Key points:

- Equilibrium point is where the supply and demand curves intersect.
- The equilibrium price is the price at this intersection.
- The equilibrium quantity is the quantity bought and sold at this price.

Importance of the Memorandum for Exam Preparation

Reviewing the June 2013 Memorandum helps students understand the expected answers and the marking scheme, ensuring they align their responses accordingly. It clarifies misconceptions, provides model answers, and offers insights into how marks are allocated for each question. For educators, it serves as a guide to develop teaching strategies and assessment criteria.
